

## **Job Title: Autoclave Validation Engineer**

Looking for an experienced validation engineer who can help generate the cycle development, performance qualification, and summary reports for a new autoclave. Client installed the autoclave last year and has completed the SAT and FAT as well as vendor and client IOQ. They need someone who is familiar with autoclaves who can generate the cycle development protocol. They currently have an older autoclave on its last leg and could potentially develop off the current cycle, but this is a newer and different brand. The client has 3 separate cycles they need to generate protocols for. Their wrapped goods cycle is the most used one, then one for liquid and one for carboy. They may take a phased approach and start with the wrapped goods and go onto the other cycles after.

This resource will need to write the protocols and then help with the execution. If the run is successful a summary report will then need to be generated. After the cycle development protocols are finished, they will need to generate and execute the performance qualification as well. There are manufacturing associates to support but otherwise this person needs to be a driver.

**Skills: Sterilization cycles with autoclaves**

**Biological Indicators – MUST**

**Plus: Steris Autoclave experience**

**Experience: 7-8 years .**

**Need someone who has done full lifecycle development process for Autoclave**
